

Project Name	MeetingMind AI — Meeting Productivity Intelligence System
Project Type	AI-Powered Business Intelligence Web Application
Target Industry	Technology Companies
Project overview	MeetingMind AI is an intelligent meeting productivity analysis system designed to address the growing problem of unproductive, poorly managed meetings in technology companies. The system uses Natural Language Processing (NLP) and machine learning to automatically analyze meeting notes and transcripts, extract action items, score meeting effectiveness, and detect recurring operational issues across teams.
Business Problem Statement	Technology companies globally lose an estimated 30–40% of productive work hours to inefficient meetings. Key problems include: • No automated follow-up — action items discussed in meetings are often forgotten or untracked • Zero visibility into meeting quality — managers cannot measure whether meetings are productive • Repeated unresolved issues — the same problems are raised across multiple meetings without resolution • Manual effort — employees manually write and distribute meeting minutes, wasting time • No cross-team analytics — leadership has no data on which teams have the most meeting inefficiencies
Project Objectives	• Automatically extract action items and decisions from meeting text using NLP • Generate a meeting effectiveness score (0–100) based on measurable quality indicators • Detect recurring themes and unresolved issues across meeting history • Provide a management dashboard with team-level productivity trends and analytics • Reduce time spent on manual meeting documentation by at least 60%

Project Scope	In Scope - Meeting text/transcript input via web interface - NLP-based action item extraction and classification - Meeting effectiveness scoring algorithm - Recurring issue detection across meeting history - Team-level analytics dashboard with visualizations - User authentication and role-based access (team member, manager, admin) - Full Business Analysis documentation (AS-IS, TO-BE, requirements, stakeholder analysis) Out of Scope - Real-time audio/video meeting integration (future phase) - Calendar system integration (future phase) - Mobile application (future phase) - Multi-language support (future phase)															
Expected Benefits	<table><tr><th>Benefit</th><th>Metric</th><th>Target</th></tr><tr><td>Reduced documentation time</td><td>Hours per week saved</td><td>60% reduction</td></tr><tr><td>Improved action item completion</td><td>Tasks completed on time</td><td>40% improvement</td></tr><tr><td>Better meeting quality</td><td>Average effectiveness score</td><td>>70 / 100</td></tr><tr><td>Reduced recurring issues</td><td>Repeated unresolved topics</td><td>50% reduction</td></tr></table>	Benefit	Metric	Target	Reduced documentation time	Hours per week saved	60% reduction	Improved action item completion	Tasks completed on time	40% improvement	Better meeting quality	Average effectiveness score	>70 / 100	Reduced recurring issues	Repeated unresolved topics	50% reduction
Benefit	Metric	Target														
Reduced documentation time	Hours per week saved	60% reduction														
Improved action item completion	Tasks completed on time	40% improvement														
Better meeting quality	Average effectiveness score	>70 / 100														
Reduced recurring issues	Repeated unresolved topics	50% reduction
